## ALIGNMENTS

AAW56171-248 represent anti-inflammatory tripeptides of the invention.

They are derived from the formulae: Xaa-Glu-Arg, Arg-Glu-Xaa, Xaa-Arg-CC They are derived from the formulae: Xaa-Glu-Arg, Arg-Glu-Xaa, Xaa-Arg-CC Glu, or Glu-arg-Xaa, where Xaa = any amino acid residue. Cyclic cdrivatives of the peptides also function as anti-inflammatory agents.

CC The peptides can be covalently linked to one another either directly or CC through a spacer. The peptides and their derivatives have macrophage inhibitory and T-cell inhibitory activity and thus, anti-inflammatory cc activity. The peptides and compositions have anti-immune activity, i.e. cinhibitory effects against a cellular and humoral immune response, es and derivatives - used for treating, e.g. litis, auto-immune disease, allergy asthma, ansplant rejection or Alzheimer's disease. phage inhibitory activity; fibronectin; ty; adherence; extracellular matrix; tor expression; inflammation. serman P, Hirschberg DL; le; 3 AA. English. O LTD. tide. 376P. 3141. 4301. 0295.  $\overline{z}$

The peptide is useful for treating a disease state, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerossis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. This sequence represents a human targeting peptide selective for human organs, tissues or cell types
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ď
including a response not associated with inflammation. The peptides also inhibit the ability of macrophages and T-cells to adhere to extracellular matrix components and fibronectin, as well as up-regulated fas receptor expression in T-cells. They can be used to inhibit unwanted immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New targeting peptides identified by phage display, useful for treating disease state, e.g. cancer, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial or viral infection or cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                  Targetting peptide selective for human organ, tissue or cell type #313.

An antigenic conjugate, useful as a vaccine for AIDS, has the formula (SPNE). (OMPC), where SPNE is a selected principal neutralisation epitope of HIV, which is one of 16 specified polypeptides (including the present sequence) or their fragments containing at least 5 amino acids; OMPC is purified outer membrane proteosome of Neisseria (pref. N. meninglitidis); and n is 1-200, indicating the number of SPNE moieties covalently linked to the OMPC. The conjugates may be substituted by anions, and conjugation may be via a bigeneric spacer. The SPNE polypeptides bind an HIV broadly neutralising monoclonal antibody (559 antibody) that binds gpl20 and also inhibits the binding of HIV to CD4. They were originally identified in the bitope polypeptides accessible to the antibody. The libraries were ALPHA and EPSILON described in AAR83295 and AAR83299 respectively. The sequences of these polypeptides were deduced from their corresponding DNA sequence.
                                    This sequence corresponds to AA 330-333 of amyloid precursor protein. This peptide, which partially overlaps the C-terminal side of thet actisequence RERMS (AARS4661), acts to antagonize the activity of secreted APP (695 AA). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antigenic conjugate useful as vaccine for AIDS - comprising HIV principal neutralisation epitope covalently linked to outer membrane proteosome of Neisseria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     selected principal neutralisation epitope; vaccine; HIV; membrane proteosome; Neisseria; OMPC; AIDS; 559 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV principal neutralisation epitope binding to 559 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 10; DB 2; Length 4; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR41636-57 represent the cores of internalisation signals which were used in the method of the invention for modulating receptor mediated transport of a ligand into a cell. These sequences are derived from the cytoplasmic tails of surface receptors. These amino acid internalisation signals have a tight turn structure. The introduction of one of these sequences into a receptor within a cell, modulates the transport of ligand into a cell having a surface receptor reactive with that ligand. This modulation can cause an increase or a decrease in endocytosis, depending on the choice of internalisation signal. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide(s) and analogues based on amyloid precursor protein - used for promoting neuronal growth in conditions involving damage to neurons or in treating Alzheimer's Disease etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Native secreted amyloid precursor protein (APP) antagonistic peptide.

These peptides are inhibitors of the zinc-dependent endopeptidase EC.3.4.24-15 and so prevent degradation of e.g. somatostatin, bradykinin, angiotensin, neurotensin, substance P, dynorphin etc. and may prevent maturation of ras oncoprotein. They are useful in treatment of pain, hypothermia, arterial hypothermia, cancer and Alzhaimer's disease. They are very selective for 24-15 with no significant action on other zinc endopeptidases such as 24-16, and are more stable, chemically, than phosphonamide peptide derivatives

These peptides are inhibitors of the zinc-dependent endopeptidase EC.3.4.24-15 end so prevent degradation of e.g. somatostatin, bradykinin, angiotensin, neurotensin, substance P, dynorphin etc. and may prevent maturation of ras oncoprotein. They are useful in treatment of pain, hypothermia, arrerial hypothermia, cancer and Alzheimer's disease. They are very selective for 24-15 with no significant action on other zinc endopeptidases such as 24-16, and are more stable, chemically, than phosphonamide peptide derivatives
                                                                                                                                                                                                                                                                                                                                                                                  1...2
/note= "Z-Phe-psi[PO2CH2]-Gly, where Z is benzyloxy-carbonyl and -psi[PO2CH2]- indicates replacement of the pepide inhage -CONH- between Phe and Gly by the group PO2CH2-"
                                                                                                     Zinc endopeptidase; EC.3.4.24-15; selective inhibitor; analgesic; pain; hypothermia; arterial hypertension; cancer; Alzheimer's disease; phosphinic acid; pseudopeptide linkage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide derivs. contg. phosphonic acid gp. replacing an amide bond are highly specific inhibitors of endo:peptidase 24-15, for treating hypothermia, hypertension, cancer, Alzheimer's disease etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Peptides AAW46520-53 contain protease binding sites. They are used to produce novel reagents whose fluorescence increases in the presence of particular proteases. These fluorogenic protease indicators (substrates) convoided high intensity fluorescent signal at a visible wavelength when they are digested by a protease. The fluorogenic indicators have the contenting a protease binding site, e.g. AAW46520-53. Fl and F2 are contenting a protease binding site, e.g. AAW46520-53. Fl and F2 are contenting a protease binding site, e.g. AAW46520-53. The and F2 are conformation-determining regions that introduce a bend into the composition which positions the fluorophores adjacent to each other with a separation of less than 100 Angstrom. When n is 1, 31 is content the terminal alpha amino group of C1 by a peptide bond. The protease indicators are used for detecting protease of indicators are used for detecting protease activity in a biological sample. The sample is contacted with the indicator and any change in fluorescence is detected, an increase in contacted for detecting protease activity.
                                                                                                                                                                                                                                Fluorogenic substrates for protease determination - having two closely spaced fluorophores flanking protease binding site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human immunodeficiency virus-1; HIV-1; protease; provirus; L-2 cell; mutation; Nef protein; immunogen; apoptosis; treatment; hybridisation; cell lysis; chemotherapeutic; toxin; HIV infection; MO/LAI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying DNA encoding inducible or suppressible cytochrome P450 - by screening for drugs which reduce the catabolism of retinoic acid, useful in cancer chemotherapy and the treatment of acne and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Protease binding site; protease; protease indicator; fluorescent signal; detection; protease activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is a degenerate peptide from which the PCR primer used in the amplification process is derived. The PCR involves the inducible cytochrome P450 gene which produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. A form of cytochrome P450 is P450RAI which specifically metabolises a derivative of retinoic acid (RA). It is highly induced by RA in cell lines and tissues. This allows for the development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAW87481 to AAW87486 represent human immunodeficiency virus-1 (HIV-1) sequences in Mo/LAI cells that were used for comparing the mutant amino cid sequences of the defective HIV provirus in L-2 cells. AAV1858 to AAV1853 represent the portions of pol protease (prot.), vpr. env (gpl20 and gp41), and nef gene regions that were mutated as compared to wild-type HIV-1 in LAI or Mo/LAI cells. The invention relates to mutated DNA, proteins or fragments of defective HIV-1 provirus in L-2 cell line. The mutations result in non-infectious HIV-1 particles. Inactive, protease-corping appropriate in HIV-1 particles. Inactive, protease-corping appropriate in HIV-1 sero-negative or -positive subjects, specifically those with HIV-1 sero-negative or -positive subjects, specifically those with HIV-1 infection, both for prevention and treatment. Fragments of nef gene and fragments encoding specific mutant of met gene and fragments encoding specific mutant corresponding mutant proteins are detected in immunoassays using corresponding mutant proteins are detected in immunoassays using corresponding attached to a radioisotope, chemotherapeutic agent or toxin, can be used to reduce the severity of HIV infections. (Updated on 17-OCT-can be used to reduce the severity of HIV infections. (Updated on 17-OCT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human immunodeficiency virus-1; HIV-1; protease; provirus; L-2 cell;

the defective human immunodeficiency virus-1 (HIV-1) provirus in L-2 cells. They represent the portions of pol protease (prot.), vpr. env cells. They represent the portions of pol protease (prot.), vpr. env cells. They represent the portions of pol protease (prot.), vpr. env (gp120 and gp41), and enf gene regions that were mutated as compared to wild-type HIV-1 in LAI or MO/LAI cells. The invention relates to mutated to mutations result in non-infectious HIV-1 particles containing at least one of Nef truncated protein fragments are used as immunogens, particularly for truncated protein fragments are used as immunogens, particularly for reducing or preventing apoptoas in HIV-1 sero-negative or -positive conjugation or preventing apoptoas in HIV-1 infection, both for prevention and treatment. Fragments of nef gene and fragments encoding specific and treatment. Fragments of nef gene and fragments encoding specific mutant Nef proteins are also useful in hybridisation tests for diagnostic corresponding mutant protein are detected in immunoassays using antibodies. The protease-deficient HIV-1 particles and antibodies, contionally attached to a radioisotope, chemotherapeutic agent or toxin, coptionally attached the severity of HIV infections. The present sequence represents an immunisation motif normally excluded, but which may be used with advantage for tolerisation by itself or in conjunction with other epitope sequences from the present invention. The present invention describes a polypeptide comprising a human myelin basic protein (hMBP) fragment including P89-101 of hMBP, excluding native hMBP. The term P89-101 is not defined but may be intended to mean amino acids 89-101 of hMBP. The polypeptide can be used for tolerising a mammalian host immune system comprising and T cells to an immunogen of interest, wherein said immunogen is restricted by a transplantation antigen of said host. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-
                                                                                                                                                                                             Polypeptide comprising human myelin basic protein fragment - useful as immuno modulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mammalian Ii key peptide; mammalian invariant chain protein; allergy;
immune response; MHC class II; antigenic; autoimmune disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related disease, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, and high selerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated protein 2 (MAP2), neurofilament-M, neurofilament-F, presentiin I, presentiin II, glial fibrillary acidic protein (GRAP), the cellular tumour antigen ps; Hecell leukemia/lymphoma 2 (bcl-2) prote-oncogene, semaphorin III, high mobility group protein-C (HMGP-C) and neuroendocrine specific protein A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

modulation of immune response, e.g. for treating malignant, allergic autoimmune disease or allograft rejection.
```

Example 1; Page 27; 149pp; English.

The present sequence represents an AE101 analogue effector compound used in the present invention. The present invention describes a mammalian invariant chain protein (Ii) key peptide of sequence LRMKLPKPEKVSKMR and modifications with the exclusion of peptide YRMKLPKPPKPSKNR. WHC class II molecules are synthesised in the endoplasmic reticulum with their antigenic peptide sites blocked by the invariant chain protein (Ii). The products and method can be used for the modulation of an immune response for therepoutic or diagnostic purposes. The enhancement of immunity can be used in the treatment of e.g. mailgnant or allergic disease. The immunosuppression can be used for the treatment of autoimmune disease, e.g. rheumatoid arthritis, multiple sclerosis, diabetes mellitus, lupus erythematosus, and psoriasis or allograft rejection

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                   February 28, 2006, 08:53:26; Search time 0.172097 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

Sequence 4, Application US/08549008

Patent No. 5714342
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Fackard, Beverly S.
APPLICANT: Packard, Beverly S.
TITLE OF INVENTION: Compositions for the Detection of
TITLE OF INVENTION: Compositions for the Detection of
TITLE OF INVENTION: Protease in Biological Samples and Methods of Use Thereof
NUMBER OF SEQUENCES: 56
CORRESPONDENCE ADDRESS:
ADDRESSE: Twomsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequence 15. Application US/09919124

Facent No. 6557296

GENERAL INFORMATION:

APPLICANT: Lufting, Ronald B.

TITLE OF INVENTION: No. 6557296-Infectious, Protease Defective HIV Particles and
TITLE OF INVENTION: Nucleic Acid Molecules Encoding Therefor
FILE REFERENCE: PIM 4867

CURRENT APPLICATION NUMBER: US/09/919,124

CURRENT FILING DATE: 2001-07-30

PRIOR APPLICATION NUMBER: 60/043,047
                                                          GENERAL INFORMATION:

Patent No. 6670147
GENERAL INFORMATION:
APPLICANT: Heidtmann, Hans H.
Mueller, Rolf
Sedlacek, Hans-Harald
TITLE OF INVENTION: NUCLEIC ACID CONSTRUCT FOR EXPRESSING
ACTIVE SUBSTANTES WHICH CAN BE ACTIVATED BY PROTEASES, AND
PREPARATION AND USE
                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 2, Application US/09680201
Patent No. 6664371
GENERAL INFORMATION:
APPLICANT: Nachman, Ronald J
APPLICANT: Garside, Christopher S
APPLICANT: Tobe, Stephen S
TITLE OF INVENTION: Mimetic Insect Allatostatin Analogs for Insect Control
FILE REFERENCE: P.C. 0047.99-Ronald J. Nachman et al.
CURRENT APPLICATION NUMBER: US/09/680,201
CURRENT FILING DATE: 2001-01-19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               belows.

Bhycobilisome 8K linker protein - Synechococcus sp. (PCC 7002) (fragment)

C;Species: Synechococcus sp.

C;Date: 14-May-1993 #sequence_revision 14-May-1993 #text_change 07-May-1999

C;Accession: E60691

R;Bryant, D.A.; de Lorimier, R.; Guglielmi, G.; Stevens Jr., S.E.

Arch. Microbiol. 153, 550-560, 1990

A;Title: Structural and compositional analyses of the phycobilisomes of Synechococcus
                                                                                                                                                           Cytochrome c553 - Desulfovibrio desulfuricans (fragment)
Cybecies: Desulfovibrio desulfuricans
Cybecies: Desulfovibrio desulfuricans

```
thyrotropin-releasing hormone receptor, splice form 387 - rat (fragment)
C;Species: Rattus norvegicus (Norway rat)
C;Species: Rattus norvegicus (Norway rat)
C;Accession: A45096
R;de la Pena, P.; Delgado, L.M.; del Camino, D.; Barros, F.
J. Balol. Chem. 267, 25703-23708, 1992
A;Title: Two isoforms of the thyrotropin-releasing hormone receptor generated by alternat A;Reference number: A45096
A;Accession: A45096
A;Accession: A45096
A;Status: preliminary; not compared with conceptual translation
A;Status: preliminary; not compared with conceptual translation
A;Residues: 1-15 < DEL>
A;Cross-references: UNIPARC:UPI0000170C44; GB:S51512; NID:g261982; PIDN:AAB24549.1; PID:gA;Reperimental source: GH3 anterior pituitary cells
A;Rote: sequence extracted from NCBI backbone (NCBIP:120927)

Determining the angiogenic index of a tissue or cell sample using expression levels of differentially expressed genes, useful for diagnosing or treating cancer, coronary artery disease, myocardial ischemia and/or arteriosclerosis.

Claim 23; SEQ ID NO 44; 296pp; English.

The invention relates to a method of determining the angiogenic index of a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present

The polypeptides and polymucleotides are useful for treating and diagnoshig immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sclerosis, Sjogren's syndrome, vasculitis, artoridusis, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the
invention are useful for diagnosing, preventing and/or treating cancer, coronary artery disease, myocardial ischemia or coronary arteriosclerosis. They can also be used in research, drug discovery and forensic medicine involving angiogenesis. This sequence corresponds to one of the differentially expressed proteins of the invention.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences data for this patent did not form part of the ABB72072). The sequence data for this patent did not form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving aberrant procein expression or biological activity. The polypeptide and polynucleotide sequences have applications in

The present invention relates to high throughput screening assays for agents capable of modulating the activity of ATP-binding cassette transporter I (ABCA1, also called cholesterol efflux regulating protein (CERP)). The method comprises determining the activity of an ABCA1 polypeptide in the presence of an ABCA1-interacting protein (AIP) that polypeptide in the presence of an ABCA1-interacting protein (AIP) that has been contacted with an agent. The method is useful for identifying agents that modulate cholesterol or phospholipid levels in an animal. The method is useful for treating disorders of lipid metabolism, especially for reducing elevated plasma phospholipid or cholesterol levels in a patient at risk of developing disorders such as cardiovascular in a patient at risk of developing disorders such as cardiovascular clisease (CMD), coronary aretery disease (CMD), cerebrovascular disease, coronary restenosis, and peripheral vascular disease. The present
